Day 4

Detailed Documentation for Dynamic Components and Functionalities

Step 1: Functionalities Overview

The project implements the following core functionalities for a dynamic and responsive food delivery marketplace:

- Product Listing Page
- Dynamic Route
- Cart Functionality
- Checkout
- Price Calculation

Each of these features works perfectly to provide users with a seamless experience when browsing, selecting, and purchasing food items.

Step 2: Functionalities in Detail

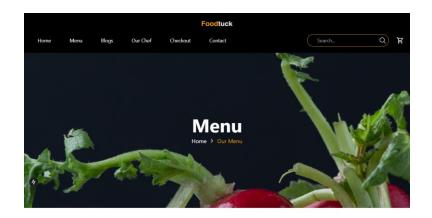

1. Product Listing Page

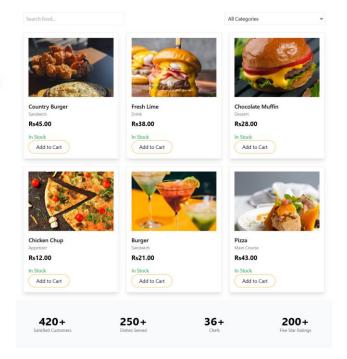

The **Product Listing Page** serves as the primary interface where customers can view all available food items in a user-friendly and attractive layout. Products (food items) are fetched dynamically from a content management system (CMS), such as Sanity CMS.

Key Features:

- Sorting & Filtering: Users can sort products based on categories like " Appetizer" "Main Course" etc
- Pagination: Ensures smooth navigation even with a large number of products.
- Responsive Design: Adaptable layout for mobile, tablet, and desktop devices.

0	Integration with Sanity CMS: Real-time product updates from the backend are automatically reflected on the frontend.

                                                        const [filteredFood, setFilteredFood] = useState<Food[]>([]);
   const [categoryFilter, setCategoryFilter] = useState("All");
                                                        const [isPopupOpen, setIsPopupOpen] = useState(false);
                                                        const [popupItem, setPopupItem] = useState<Food | null>(null);

                                                           async function fetchFoodItems() {
 TS next.config.ts
```

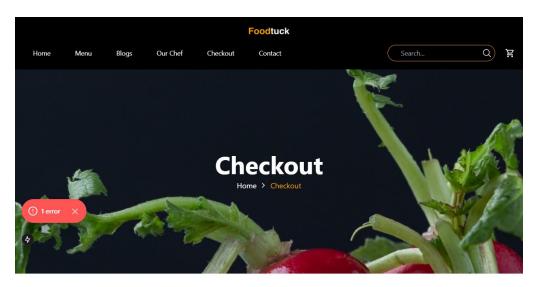

2. Dynamic Route

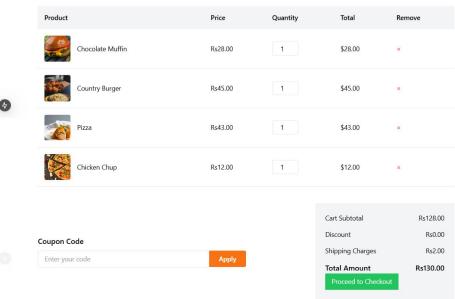

Dynamic routing allows for the creation of individual pages for each food item, enabling detailed information to be shown for every dish or menu item.

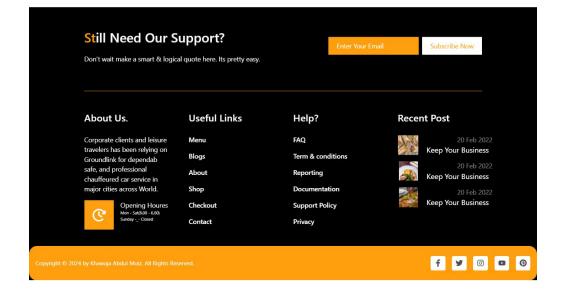

Key Features:

- o Unique URLs for each food.
- Server-side rendering (SSR) for SEO benefits and fast initial load times.
- Displays details such as the food description, images, ingredients, pricing, and availability.
- Scalable for a growing menu, with new items automatically generating corresponding pages.

3. Cart Functionality

The **Cart Functionality** tracks the items that the user has added to their cart. This functionality is crucial for providing a seamless shopping experience, ensuring customers can easily review, modify, and check out their selected items.

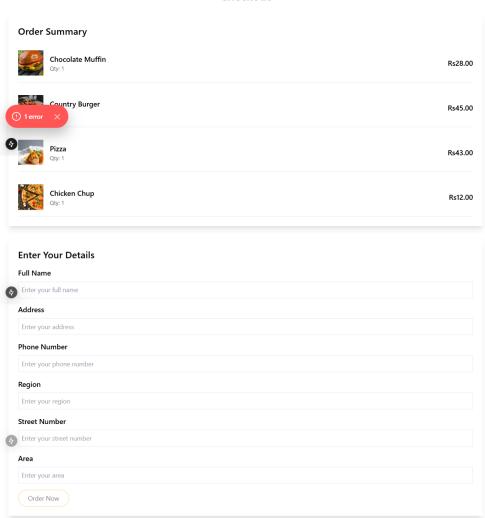

Key Features:

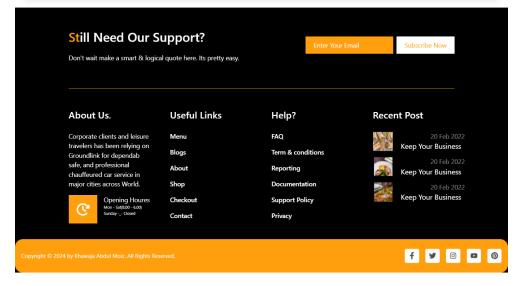

- Add items to the cart from both product listings and individual product pages.
- o Real-time cart updates as quantities are changed or items are removed.
- Persistent cart data via local storage or session storage, ensuring data is retained across page refreshes.

4. Checkout

Checkout

The **Checkout** process is streamlined to ensure a smooth, secure, and efficient transaction.

Key Features:

- Multi-step process: Collection of billing, shipping, and payment details.
- A progress tracker visually shows the user where they are in the checkout process.
- Validation ensures all required fields (address, payment details) are correctly filled.
- o **Order Summary** displayed for review before final submission.

5. Price Calculation

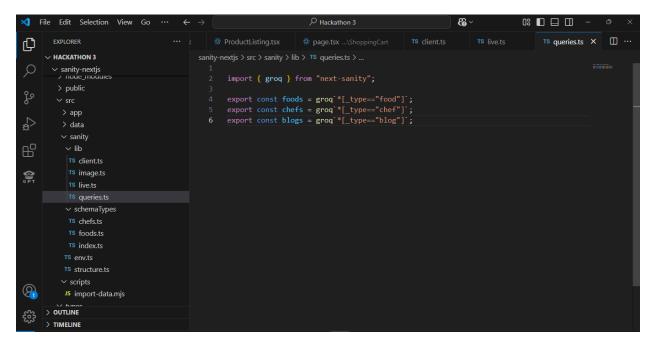

The **Price Calculation** functionality calculates the total cost of the cart, including taxes, delivery fees, and discounts.

Key Features:

- Real-Time Updates: Subtotal recalculates dynamically as users add or remove items from the cart.
- Discounts and Promotions: Ability to apply promotional codes or bulk discounts.
- Transparency: Detailed breakdown of item costs, taxes, delivery charges, and final price.

Step 3: Integration with Sanity CMS

Sanity CMS powers the backend for managing dynamic food-related content, providing flexibility and real-time updates without the need for developers to change the code.

Key Features:

- All food items, categories (e.g., appetizers, main courses, desserts), and additional metadata (e.g., ingredient lists, dietary preferences) are stored and managed in **Sanity CMS**.
- Client-Side Querying retrieves product data dynamically, ensuring the latest content is always shown.
- Extensibility: As the menu grows, new categories or fields can be added to support the platform's scalability.

Conclusion

This documentation outlines the key functionalities required for building a dynamic and user-friendly food delivery marketplace. By utilizing **Sanity CMS** for backend management, **React** for frontend development, and integrating dynamic functionalities, we achieve a responsive and scalable platform that can easily grow with the needs of the business.
